

## EXAMPLES AND COMMENTS ON A FROBENIUS THEOREM

James McInerney and Jerry MEYER

*Abstract.* A fixed point theorem by Carlsson, concerning a circle fibration, Thom's example and an observation about vector bundles are given.

The first author of this note proved the following fixed point theorem [1] and J. Dugundji, A. Granas [2], p. 12.

**THEOREM 1.** Let  $(E, p)$  be a complex vector space. Suppose that  $F(E, \pi, E)$  is a  $\pi$ -manifold,  $\pi \in \mathbb{N}$

$$(1) \quad d_x p, \pi(x) \in \pi(x), \quad \forall x \in E$$

where  $p: E_1 \rightarrow E_2$  implies the following two conditions

- (i)  $\pi$  is nondecreasing and necessarily constant
- (ii) the  $\pi(x)$ 's are  $\pi$ -sets.

Then  $F$  has a unique fixed point  $\pi(x)$  and the  $F^k(x)$ 's go to  $\pi(x)$ .

Here  $\pi$  is the map  $E_1 \rightarrow E_2$ ,  $F$  and  $F^k$  denote the  $\pi$ -set levels of  $\pi$  and  $F$  respectively.

The theorem appeared to be useful and easy to handle with in the theory of fixed point equations [1], [2] and therefore it seems to be of interest to consider the question of validity of the assumptions governing  $\pi$  and to wonder, in the present work, whether to delete the condition showing in particular, that the answer is no. Example 1 shows that the condition (ii) is unnecessary, if  $\pi$  would be constant, but one easily observes that the both conditions (i) and (ii) imply

$$(2) \quad \pi(x) \in \pi(x) \quad \forall x \in E.$$

This inequality plays an important role in the proof of Theorem 1 (ii) [1] as well as [2], p. 12. Whether one could expect that by dropping one other condition (ii) by (2), our Example 1 would be negative this is still an open question. In the Example 1 we show that our Assumptions (i), (2) cannot be replaced by (2), (iii).

Received Jan. 12, 1980.

On the other hand, it is clear that if  $\mathcal{P}$  does not satisfy the stronger condition (ii), if for some  $x, y \in \mathbb{R}$   $\mathcal{P}(x, y) \neq 0$ , then in  $\mathbb{R}^2$   $\mathcal{P}(x, y)$  does not satisfy the condition (ii) and (ii) is not satisfied in applications, since both the conditions (ii) and (ii) can be replaced by one (ii). More-Over, (ii) is the case when both cases can be proved. Finally, as a corollary of the main theorem in [9] we have the following result:

**Theorem 4.** If (ii) is complete and convex,  $\mathcal{P}(x, y)$  satisfies (i) and  $\mathcal{P}$  satisfies (ii) then there exists a continuously convex and continuously differentiable function  $f: \mathbb{R} \rightarrow \mathbb{R}$ , such that  $\mathcal{P}(x, y) = f(x) - f(y)$  and

$$f'(x) = \lim_{y \rightarrow x} \frac{\mathcal{P}(x, y)}{x - y} \quad \text{for all } x \in \mathbb{R}.$$

**Example 1.** Let  $\mathcal{P}$  be a function  $\mathcal{P}: \mathbb{R}^2 \rightarrow \mathbb{R}$  and let  $\mathcal{P}$  be the set of rational numbers. The function  $\mathcal{P}(x, y)$  defined as follows:

$$\mathcal{P}(x, y) = \begin{cases} x - y & \text{if } x, y \in \mathbb{Q} \\ 0 & \text{if } x, y \notin \mathbb{Q} \\ x + y & \text{if } x, y \in \mathbb{R} \setminus \mathbb{Q} \end{cases}$$

is an additive relation  $\mathcal{P}: \mathbb{R}^2 \rightarrow \mathbb{R}$  for the family of all additive classes. This

is the case if  $\mathcal{P}(x, y) = \mathcal{P}(y, x)$  and  $\mathcal{P}(x, x) = 0$  for all  $x \in \mathbb{R}$ .

By the same of [10] (see also [11] and [12]) we have

$$\mathcal{P}(x, y) = \mathcal{P}(y, x) \quad \text{for all } x, y \in \mathbb{R}.$$

Now we define the functions  $F, \tilde{F}: \mathbb{R} \rightarrow \mathbb{R}$  by the formulae

$$F(x) = \begin{cases} x & \text{if } x \in \mathbb{Q} \\ 0 & \text{if } x \in \mathbb{R} \setminus \mathbb{Q} \end{cases} \quad \tilde{F}(x) = \begin{cases} 0 & \text{if } x \in \mathbb{Q} \\ x & \text{if } x \in \mathbb{R} \setminus \mathbb{Q} \end{cases}$$

and the function  $\mathcal{P}: \mathbb{R}^2 \rightarrow \mathbb{R}$  by the formula

$$\mathcal{P}(x, y) = \begin{cases} F(x) - F(y) & \text{if } x, y \in \mathbb{Q} \\ 0 & \text{if } x, y \in \mathbb{R} \setminus \mathbb{Q} \\ \tilde{F}(x) + \tilde{F}(y) & \text{if } x, y \in \mathbb{R} \end{cases}$$

It is clear that  $\mathcal{P}$  is additive for  $x, y \in \mathbb{R}$ . If  $x, y \in \mathbb{Q}$ , for some  $m, n \in \mathbb{Z}$ ,  $x = m/n$ ,  $y = p/q$ , if there is no such  $n, q$  that  $nq \neq 0$  and  $mq - np = 0$ , then  $\mathcal{P}(x, y) = 0$  and, if  $mq - np \neq 0$ , then  $\mathcal{P}(x, y) = x - y$ . If  $x, y \in \mathbb{R} \setminus \mathbb{Q}$ , then  $\mathcal{P}(x, y) = 0$  and  $\mathcal{P}$  is a quasilinear.

In the same way we can verify that  $\mathcal{P}$  is a quasilinear by Theorem 4. It follows immediately from the definition of  $\mathcal{P}$  that  $\mathcal{P}(x, y) = 0$  for each  $x, y \in \mathbb{R}$ , in condition (ii) holds. Thus, except of (ii), all the conditions of of the Theorem 4 are fulfilled. On the other hand, we can easily observe that the set of fixed points is the case of mapping  $\mathcal{P}$  is not empty and in the case of mapping  $\mathcal{P}$  is empty.

**Remark 1.** Conditions (i) and (ii) does not imply convexity, the uniqueness of fixed point of  $\mathcal{P}$ .

**Example 2.** Let  $X = \{x_n : n \in \mathbb{N}\}$  be an arbitrary countable set. Define  $d : X \times X \rightarrow \mathbb{R}$  as follows:

$$d(x_n, x_m) = 1 + \frac{1}{n} + \frac{1}{m} \text{ for } n \neq m \text{ and } d(x_n, x_n) = 0.$$

Verify that  $d$  is a complete metric space. Show that the metric  $d$  has the following property:

$$(E) \quad d(x_n, x_m) = d(x_n, x_l) \text{ for } (n, m) \neq (l, m) \Rightarrow x_n = x_m = x_l \text{ for } n, m, l \in \mathbb{N}$$

i.e. all the distances  $d(x_n, x_l)$  for  $l \neq n$  are different.

Let  $F : X \rightarrow F$  be the mapping map  $F(x_n) = x_{2n}$ . Show that the set

$$F = \{d(x_n, x_{2n}) : n \in \mathbb{N}\}$$

is countable and

$$d(F(x_n), F(x_m)) = d(x_{2n}, x_{2m}) < d(x_n, x_m) \text{ for } n \neq m$$

we can choose a positive real  $\epsilon_{2n}$  such that

$$(E') \quad x_{2n} \in B(x_n, \epsilon_{2n}) \text{ and } F(x_n, x_m) = 0 \text{ implies } x_n = x_m \text{ for } n, m \in \mathbb{N}$$

Define now  $g : X \rightarrow X$  as follows:

$$g(x) = \begin{cases} x_n & \text{if } x = x_n \\ x_{2n} & \text{if } x = d(x_n, x_{2n}) \end{cases}$$

It follows from the property (E) that  $g$  is uniquely defined. By (E') we have  $g(x) \in B(x, \epsilon_x)$  and, because  $g(x) \in B(x, \epsilon_x)$  for all  $x \in X$ , we can show that  $g(x) = x$ .

Thus  $g$  satisfies both the conditions (ii) and (iii). Moreover, by (E) and it easily follows that (i) holds, i.e.  $F$  is countable. But clearly  $F$  has no fixed point.

**Example 3.** Let the complete metric space  $(X, d)$ ,  $X \neq \emptyset$  and the map  $F$  be as in Example 2, but now define  $g : X \rightarrow X$  as follows:

$$(E'') \quad g(x) = \begin{cases} x_n & \text{if } x = x_n \\ x_{2n} & \text{if } x = d(x_n, x_{2n}) \end{cases} \text{ and } \sup\{d(x_n, x_{2n}) : n \in \mathbb{N}\} = d(x_n, x_{2n}) = 0 \text{ for } n \in \mathbb{N}$$

It follows from the definitions of  $F$  and  $g$  that  $F$  is a countable set. Hence, by  $g$  is contracting, i.e.  $g$  satisfies conditions (ii). To see that  $g$  satisfies also the first one, let every accumulation point  $r$  of  $F$  such that  $r \neq 0$ , has the form  $r = 1 + \frac{1}{n} + \frac{1}{2n}$ ,  $n \in \mathbb{N}$ .

To obtain  $g(r)$  take an arbitrary  $m$  and  $n$  such that

$$d(x_n, x_m) = 1 + \frac{1}{n} + \frac{1}{m} < 1 + \frac{1}{2n} + \frac{1}{2m}$$

Since  $\text{supp}(x_i) \cap \text{supp}(x_j) = \emptyset$  and, in view of (9), we have

$$\text{supp}(x_i) \cap \frac{1}{\text{supp}(x_j)} \cap \frac{1}{\text{supp}(x_k)} = \frac{1}{\text{supp}(x_j)} \cap \frac{1}{\text{supp}(x_k)}.$$

If  $x_i \in I$  is not an accumulation point of the set  $I'$ , then there is a maximal  $\text{supp}(x_i)$  such that  $\text{supp}(x_i) \cap I' \neq \emptyset$ . Consequently, we have

$$\text{supp}(x_i) \cap \text{supp}(x_j) \cap \text{supp}(x_k) = \text{supp}(x_i) \cap \text{supp}(x_k).$$

This implies for  $x_i \in I$  which shows that  $p$  satisfies (ii). This completes the required construction.

If  $X$  is an infinite countable  $\mathcal{C}$ -topological space in which every countable set is open, then  $X$  is a  $\mathcal{C}$ -space. This generalizes a result of Engelking and Morris.
